

AWS Lambda Exercise (Challenge)

Lab overview

In this challenge lab, you create an AWS Lambda function to count the number of words in a text file.

Objectives

After completing this lab, you will be able to do the following:

- Create a Lambda function to count the number of words in a text file.
- Configure an Amazon Simple Storage Service (Amazon S3) bucket to invoke a Lambda function when a text file is uploaded to the S3 bucket.
- Create an Amazon Simple Notification Service (Amazon SNS) topic to report the word count in an email.

Duration

This lab requires approximately **90 minutes** to complete.

Launch your lab environment

1. At the top of these instructions, choose Start Lab to launch the lab.

A **Start Lab** panel opens displaying the lab status.

2. Wait until the message "Lab status: ready" appears, and then choose **X** to close the **Start Lab** panel.

This lab provisions a new Amazon Web Services (AWS) account for you where you create the Lambda function and resources needed to complete the challenge.

Your challenge

3. Create a Lambda function to count the number of words in a text file. The general steps are as follows:

- Use the AWS Management Console to develop a Lambda function in Python and create the function's required resources.
- Report the word count in an email by using an SNS topic. Optionally, also send the result in an SMS (text) message.
- Format the response message as follows:

```
The word count in the <textFileName> file is nnn.
```

Replace *<textFileName>* with the name of the file.

- Enter the following text as the email subject: word Count Result
 - Automatically invoke the function when the text file is uploaded to an S3 bucket.

4. Test the function by uploading a few sample text files with different word counts to the S3 bucket.

5. Forward the email that one of your tests produces and a screenshot of your Lambda function to your instructor.

Hints

- Create all of your resources in the same AWS Region.
- You need an AWS Identity and Access Management (IAM) role for the Lambda function to access other AWS services. Because the lab policy does not permit the creation of an IAM role, use the **LambdaAccessRole** role. The LambdaAccessRole role provides the following permissions:
 - AWSLambdaBasicExecutionRole
This is an AWS managed policy that provides write permissions to Amazon CloudWatch Logs.
 - AmazonSNSFullAccess
This is an AWS managed policy that provides full access to Amazon SNS via the AWS Management Console.
 - AmazonS3FullAccess
This is an AWS managed policy that provides full access to all buckets via the AWS Management Console.
 - CloudWatchFullAccess
This is an AWS managed policy that provides full access to Amazon CloudWatch.
- Refer to the following lab for additional guidance:
 - Working with AWS Lambda

Conclusion

Congratulations! You now have successfully done the following:

- Created a Lambda function to count the number of words in a text file
- Configured an S3 bucket to invoke a Lambda function when a text file is uploaded to the S3 bucket
- Created an Amazon SNS topic to report the word count in an email

Lab complete

When you are finished with the lab, follow these steps end the lab:

6. At the top of this page, choose **End Lab** and then choose **Yes** to confirm that you want to end the lab.

A panel appears indicating that "You may close this message box now. Lab resources are terminating."

7. To close the **End Lab** panel, choose the **X** in the upper-right corner.
